### Abstract of the Disclosure

10 A handling device for repositioning parts having a  
pivot arm able to be pivoted about a first pivot axis and a  
handling part adapted to bear a gripper and able to be  
pivoted with respect to a second pivot axis. The handling  
part is furthermore carried so that it may be radially moved  
in relation to the second pivot axis and cooperate by way of  
15 a cam follower with a path setting cam having two linear  
terminal sections. During operation of the device the  
handling part may move along a handling path, which has two  
linear terminal sections.
